

QIE Pass

Partner Integration Documentation

Verify Once. Use Everywhere.

1. Overview

QIE Pass is a reusable digital identity and verification framework that enables businesses to offer frictionless onboarding to their users. Once a user completes identity verification through the QIE Wallet, their credentials can be reused across all integrated partner platforms, eliminating repetitive KYC processes.

By integrating with QIE Pass, partner platforms gain access to a secure, consent-driven onboarding flow, a robust API framework and a real-time partner dashboard, all without managing complex identity infrastructure in-house.

QIE Pass supports two onboarding paths: **returning users** who already have a QIE Wallet verify in seconds by reusing their credentials, and **brand-new users** with no wallet are onboarded through a QIE-hosted web flow that creates their wallet, runs KYC, and captures consent — after which they become reusable QIE Pass users everywhere.

2. The Problem We Solve

Traditional KYC and onboarding processes create friction for both users and businesses:

Challenge	Impact
Repeated KYC submissions	Users abandon onboarding mid-flow
Lengthy verification cycles	Delayed customer activation
Lack of data transparency	Low user trust and consent fatigue
High compliance costs	Significant operational overhead for businesses
Fragmented identity systems	Poor conversion and retention rates

QIE Pass resolves these challenges through a single, reusable verification layer, reducing onboarding drop-off, lowering compliance costs and building user trust through full data transparency.

3. How QIE Pass Works

The QIE Pass flow is simple and fully wallet-native. Here is what happens when a returning user onboards via a QIE Pass-integrated partner platform:

1	Onboarding Initiation The user begins the onboarding process on a partner platform that supports QIE Pass.
2	Wallet / Domain Submission The user enters their QIE Wallet address or QIE domain name on the partner platform.
3	API Request Sent The partner platform sends a secure onboarding request to QIE via the integration APIs.
4	Wallet Notification The user receives a notification inside the QIE Wallet with the partner's verification request.
5	Verification & Consent The user reviews the requested data, completes KYC (via Sumsb) if not already done and approves sharing.
6	Completion Confirmation The user is notified that onboarding is complete and prompted to return to the partner platform.
7	Partner Confirmation The partner platform receives confirmation of successful verification and onboarding.

New Users Without a Wallet — Web Onboarding NEW

Users who are completely new to QIE have no wallet to submit at step 2. For them, the partner sends the request with their own `partnerUserRef` instead of a wallet identifier, and QIE returns a hosted onboarding URL:

1	Partner Sends partnerUserRef The partner creates the request with a stable internal user reference and a return URL.
2	Redirect to QIE-Hosted Onboarding QIE returns a redirect URL. The partner sends the user to it.
3	Wallet Creation, KYC & Consent On the hosted page the user creates a QIE Wallet, completes KYC (via Sumsb), and approves data sharing.
4	Return & Confirmation The user is returned to the partner's return URL; the partner confirms verification and claims the data.

After this, the user owns a reusable QIE Wallet and becomes a returning (wallet) user at every future QIE Pass partner.

4. Core Features

Reusable KYC

Users complete identity verification once. Their verified credentials are linked to their QIE Pass profile and can be reused across any integrated partner platform, dramatically reducing onboarding time for returning users.

Wallet-Based Verification

All onboarding and verification actions are completed securely within the QIE Wallet. This ensures a consistent, controlled experience for both users and partners.

Web Onboarding for New Users NEW

Users with no QIE Wallet are onboarded through a QIE-hosted web flow. Wallet creation, KYC, and consent all happen on a secure QIE-hosted page, after which the user holds a reusable QIE Wallet — turning first-time visitors into reusable QIE Pass identities.

Consent-Based Data Sharing

Users are clearly informed of the data requested by each partner before proceeding. QIE Pass operates on an explicit consent model, ensuring transparency and regulatory alignment at every step.

Primary Wallet Validation

QIE Pass restricts verification to the user's designated primary QIE Wallet, preventing unauthorized verification attempts and ensuring consistency across all partner interactions.

Partner-Initiated Onboarding

Partner platforms can initiate QIE Pass requests directly through standardized APIs using a user's wallet address, QIE domain, or a partner-supplied user reference. This integrates cleanly into existing registration and onboarding flows.

Sumsb KYC Integration

QIE Pass integrates with Sumsb to facilitate secure, compliant identity verification. Sumsb handles document verification, liveness checks and regulatory compliance, while QIE Pass manages the credential lifecycle post-verification.

Why Sumsub?

Sumsub is a globally trusted KYC provider used by hundreds of regulated businesses. The integration ensures:

- Regulatory compliance across jurisdictions
- Secure, accurate identity verification
- Faster onboarding for returning users. Credentials already verified, no repeat submissions

5. Partner Integration Capabilities

QIE Pass provides a comprehensive API framework designed for fast, reliable integration. Partners can:

- Trigger onboarding and verification requests via API
- Track onboarding status and verification progress in real time
- Receive completion confirmations
- Manage integration credentials and API keys
- Onboard brand-new users through the QIE-hosted web flow
- Test integrations in a dedicated sandbox / staging environment

Production Access Note

Production API access is restricted to approved and whitelisted partner organizations.

Partners must complete onboarding review and receive approval before accessing production endpoints.

Sandbox access is available immediately upon integration setup.

6. Partner Dashboard

All integrated partners receive access to a self-serve partner dashboard providing complete visibility into integration performance and usage:

Dashboard Feature	Description
API Key Management	Generate, rotate, and manage API credentials securely
Sandbox Environment	Test end-to-end flows without affecting production data
Onboarding Request Tracking	Monitor verification and onboarding requests in real time
Integration Analytics	View performance metrics, conversion rates, and usage trends
API Usage Statistics	Track API call volumes, response times, and error rates
Request & Status Logs	Access detailed logs for debugging and audit purposes

7. Security & Compliance

QIE Pass is designed with security and regulatory compliance built in at every layer:

- Primary wallet validation ensures only the authorized user can initiate and approve onboarding
- All verification actions occur within the QIE Wallet or a secure QIE-hosted onboarding page
- Verified credentials and onboarding data are stored with encryption
- Transparent consent flows inform users of exactly what data is being requested and by whom
- KYC infrastructure powered by Sumsub ensures regulatory compliance across jurisdictions

8. Benefits

For Partner Platforms

Benefit	What It Means for You
Faster User Activation	Verified users onboard in minutes, not days
Low-Cost KYC	Shared infrastructure dramatically reduces per-verification costs. No need to build or license your own KYC stack
Higher Conversion Rates	Streamlined onboarding reduces drop-off significantly
Lower Compliance Overhead	Leverage QIE's compliance infrastructure without maintaining it yourself
Access to Verified Users	Reuse verified credentials. No repeated document requests from returning users
Enhanced Trust	Transparent, consent-driven data sharing builds user confidence in your platform

For End Users

- Verify once, onboard everywhere
- No repeated document submissions across platforms
- Full visibility into what data is requested and by whom
- Secure, wallet-native experience
- Simplified identity management in one place

9. Partner Integration Guidelines

To ensure a seamless onboarding experience and a successful QIE Pass verification flow, all integrating partners should follow the guidelines below.

1. Request the Primary QIE Wallet / Domain

Ask users to provide their primary QIE wallet address or QIE domain when initiating onboarding. Verification can only be completed through the user's designated primary wallet. Requests from non-primary wallets or domains will be rejected automatically.

2. Offer Web Onboarding for New Users NEW

For users who do not yet have a QIE Wallet, initiate the request with your own `partnerUserRef` and redirect them to the QIE-hosted onboarding URL. Always offer the wallet/domain path as the primary option — never make web onboarding your only path, as it would push existing wallet users through unnecessary re-verification.

3. Communicate the Primary Wallet Requirement Clearly

Display a clear prompt on your UI before users enter their wallet details to prevent onboarding failures caused by incorrect wallet input.

Suggested helper text: "Please enter your primary QIE wallet address or domain to continue with QIE Pass verification."

4. Redirect Users to the QIE Wallet

Once a QIE Pass request is successfully initiated, instruct users to open their QIE Wallet to complete verification and data-sharing approval.

Suggested message: "Your QIE Pass verification request has been initiated. Please continue the process in your QIE Wallet."

5. Account for Verification Processing Time

KYC verification may take several minutes to complete. Do not assume onboarding is finalised immediately after KYC submission, design your flow to handle delayed confirmation gracefully and keep users informed while they wait.

6. Wait for Final Approval Confirmation

Completing KYC alone does not finalise onboarding. Users must also review and approve the data-sharing disclosure within the QIE Wallet. Consider onboarding complete only after receiving a final confirmation status from QIE Pass.

7. Support Interrupted User Flows

Users may exit the QIE Wallet before completing the full flow. Design your integration to allow users to resume onboarding if verification or approval is still pending. Maintain onboarding status checks on your side until final confirmation is received.

8. Handle Request Expiry and Failures Gracefully

If a request expires, fails or is rejected due to an invalid wallet or domain, prompt the user to restart the onboarding process with a clear and helpful error message.

9. Test Thoroughly in Sandbox Before Going Live

Use sandbox API credentials to fully validate your implementation end-to-end before requesting production access. Production credentials are only issued to approved and whitelisted organisations.

Integration Best Practices

- Enable wallet/domain input validation on your UI where possible
- Offer web onboarding (partnerUserRef) for users without a wallet, alongside the wallet path
- Provide clear onboarding instructions before redirecting users to the QIE Wallet
- Inform users that KYC verification may take several minutes to process
- Maintain status polling on the partner side until final completion confirmation is received
- Clearly communicate to users when onboarding has been successfully completed

10. Getting Started as a Partner

Integrating QIE Pass is straightforward. Follow these steps to get up and running:

1	Express Interest Reach out to the QIE team to initiate the partner onboarding process.
2	Receive Sandbox Access Upon approval, receive your API credentials and access to the sandbox environment.
3	Build & Test Integration Use QIE Pass APIs to integrate onboarding flows into your platform. Validate end-to-end in sandbox.
4	Submit for Production Review Once testing is complete, submit your integration for review and production whitelisting.
5	Go Live Upon approval, activate production access and begin onboarding users with QIE Pass.

Ready to Integrate?

Visit qiepass.qie.digital to learn more or contact the QIE team to begin the partner onboarding process.

Documentation, API references, and sandbox access are available through the QIE Partner Portal.
